

NAMED AND REMOTE PRINTER ISSUES

Problem: After loading Tarantella, when sending print jobs to dlink and or remote printers....the print job goes off into internet space. Will not hit remote printer.

Solution: Kill named by typing the following command...

ps -A |grep -e named Then press **enter**

NOTE: This command will yield a process number for the named process running in the background. An example of what that would look like is shown below...

XXXX ? named

Using the XXXX reference number for your kill entry, you will type the following command from the prompt..

kill XXXX
