

## NETWORK PRINTER CANCELLATION

When trying to cancel a print job on a system that is using Network or Ethernet, follow these directions.

For a single print job type...

**# canallpr PARALLEL-44-143**

**NOTE:** The example above represents a printer that is attached to the Parallel Port on TCP-IP Spotline Number 44. In the above example you are canceling print job # 143. By hitting enter key after you have typed the above, your print job should now be cancelled. Remember, if you turned off your SpotLine or printer so that the print job would stop printing, you will now need to turn those devices back on so that the job will terminate properly.

For multiple print jobs on a Single Printer, type....

**# canallpr PARALLEL-44**

This will terminate all print jobs for workstation 44.
