

## POS Slow when Internet is down

check these files:

`/etc/resolv.conf`

`nameserver 12.127.16.67`

`nameserver 12.127.16.69`

if above example shows up rename to [resolv.conf.old](#)

if no entry is in resolv.conf then

`ps -ef |grep named`

if named is running type

`service named stop`

this will let pos work properly till internet service is restored.
