

Upgrading or Reinstalling Facet*Win*

To upgrade (or reinstall) Facet*Win* simply follow the original installation instructions. Usually this means:

1. Copy the install files, "**facetwin.z**" and "**install.sh**", to a temporary directory on the UNIX system.

```
cp facetwin.z /tmp
cp install.sh /tmp
```

2. Run the installation script.

```
cd /tmp
sh install.sh
```

Follow the guidelines below and your Facet*Win* configuration **AND** registration will be kept intact. You will not have to re-license or reconfigure Facet*Win*-- everything should remain the same after an upgrade, except for having new servers and client software.

- **DO NOT** remove the existing installation before upgrading.
- The new version should be installed right over the top of the existing installation.
- You can upgrade Facet*Win* on a running system with users connected to network drives and using terminal emulation. Users that are already connected to Facet*Win* servers will continue to run on the old servers until they re-establish their connections.
- If you have multiple cooperating UNIX systems running Facet*Win*, upgrade Facet*Win* on all UNIX systems.

After the upgrade, verify that Facet*Win's* license daemon still thinks you

have the proper number of licensed users.

Then try mapping a network drive from a freshly booted PC and try to establish a terminal emulator session. If everything seems to be working properly, pat yourself on the back -- job well done! If you have trouble with any part of the upgrade process, please contact [FacetCorp technical support](#) for assistance immediately.

Good luck!
