

Digifax Card Installation

1. To install a digifax card you will need to shutdown your machine and turn off the power. Insert the card into a large black slot. After you have put the card into place, check the corner for your switch settings. Use the illustration below by matching your switch setting to the given I/O address. Now close your box and power your machine up.
2. Type (**swinstall**) [enter]
3. Choose **Digifax 290a_auto** [enter]

When asked if you can reboot after, type (**y**) [enter]

Enter **digifax I/O address (default=12e)**, now type in your I/O address according to the switch settings [enter]

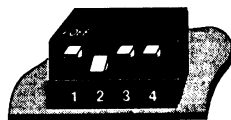

The installation will now automatically finish. **Reboot** your system when you get back to the prompt.

- The switch closest to the number is considered down, and farther from the number is considered up.
