

How to “TAR” Your Data into a Single File for Transfer

I have created a script for you to use which will search your system for userdata areas. When it finds a userdata area it will archive and compress it into a single file. To use the utility...

a. From the prompt type #tardata

The utility will keep you posted on the status of the process. The entire process may take a significant amount of time. When it completes you will see a listing of the files it has created for you. There will be one file for each dataset it finds and will be named accordingly. Please keep in mind before running this utility that it requires a large amount of disk space to perform.
